Air quality

Effect of (optimised) noise barriers on air quality

Test Site IPL A28

Jan Hooghwerff
Christiaan Tollenaar
Roy van der Heijden

Goal and research questions

Questions

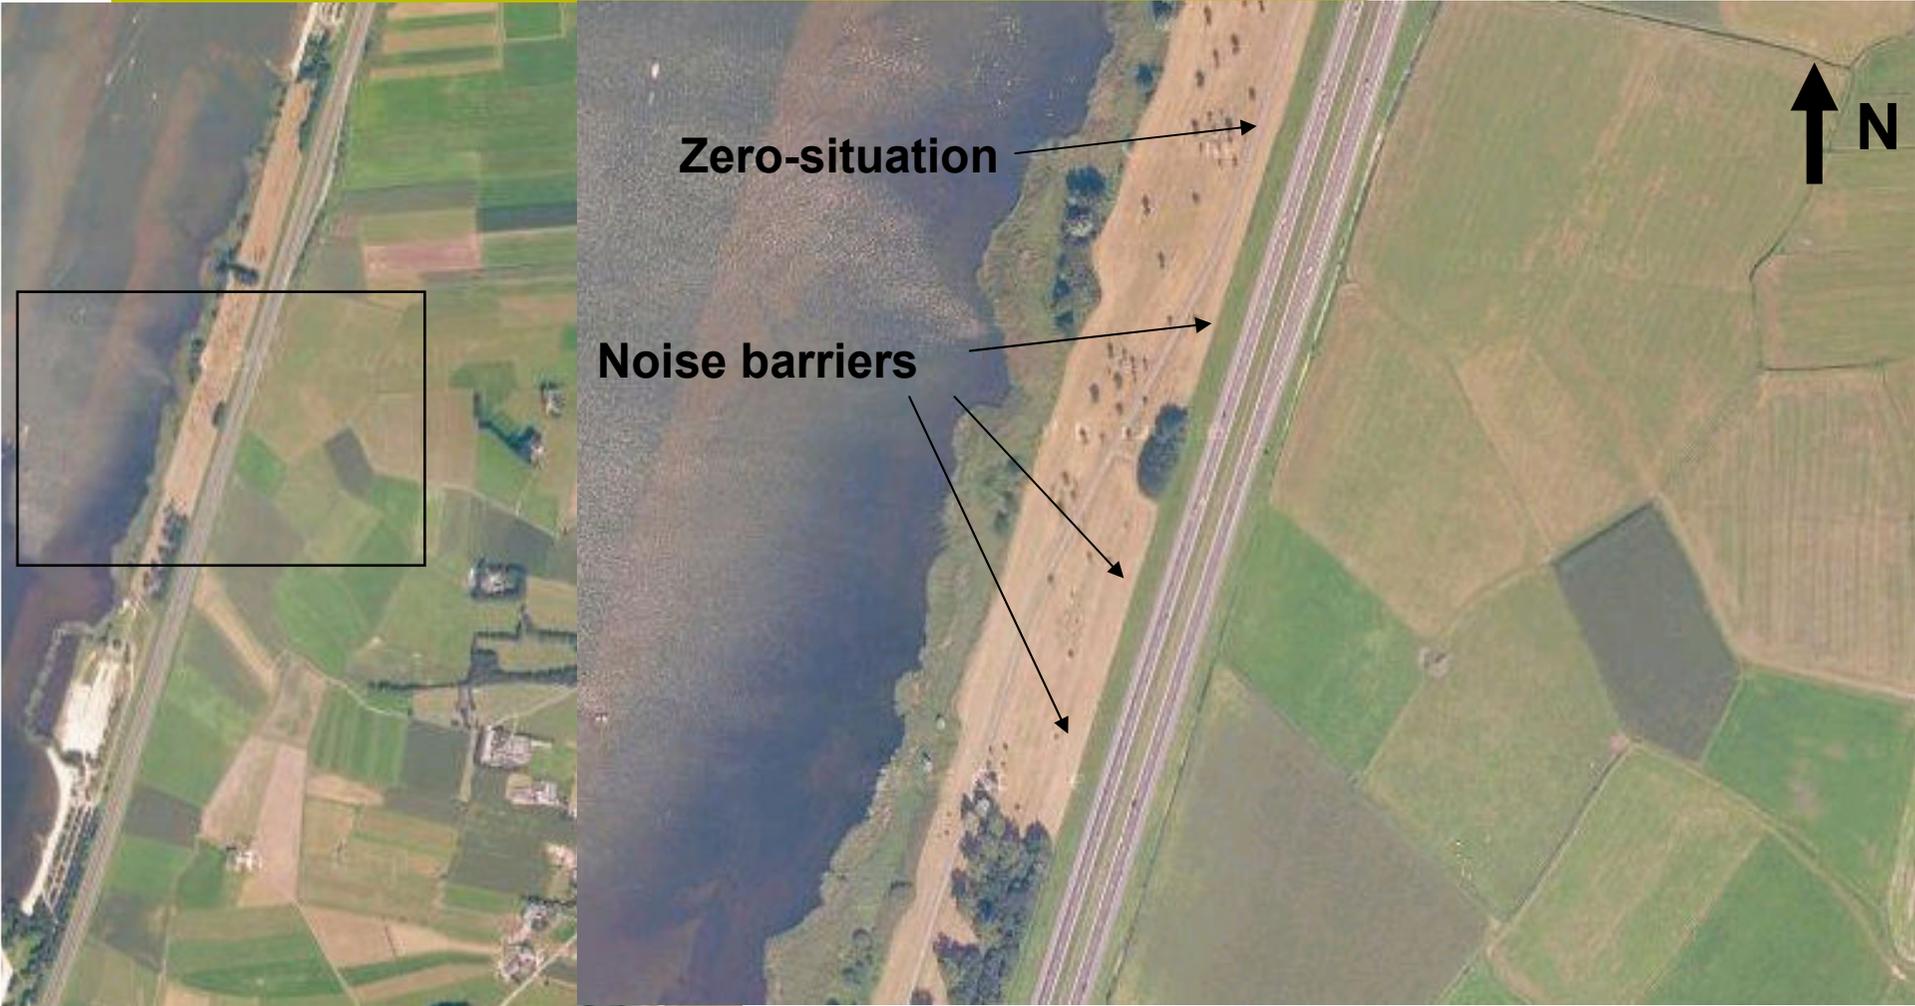

- do (noise) barriers have a significant impact on the dilution of airborne pollutants?
- can barriers be optimised for this purpose ?

Approach

- competition to induce market players to come with ideas
- investigation of ideas at the IPL Test Site

Experimental approach

$$\text{barrier effect} = (M5 - M13) / (M2 - M13)$$

With eastern wind:

background concentration = M13

road contribution = M2 - M13

What was measured?

NO_x

- continuous with NO_x-monitor
- Ozon at 3 positions

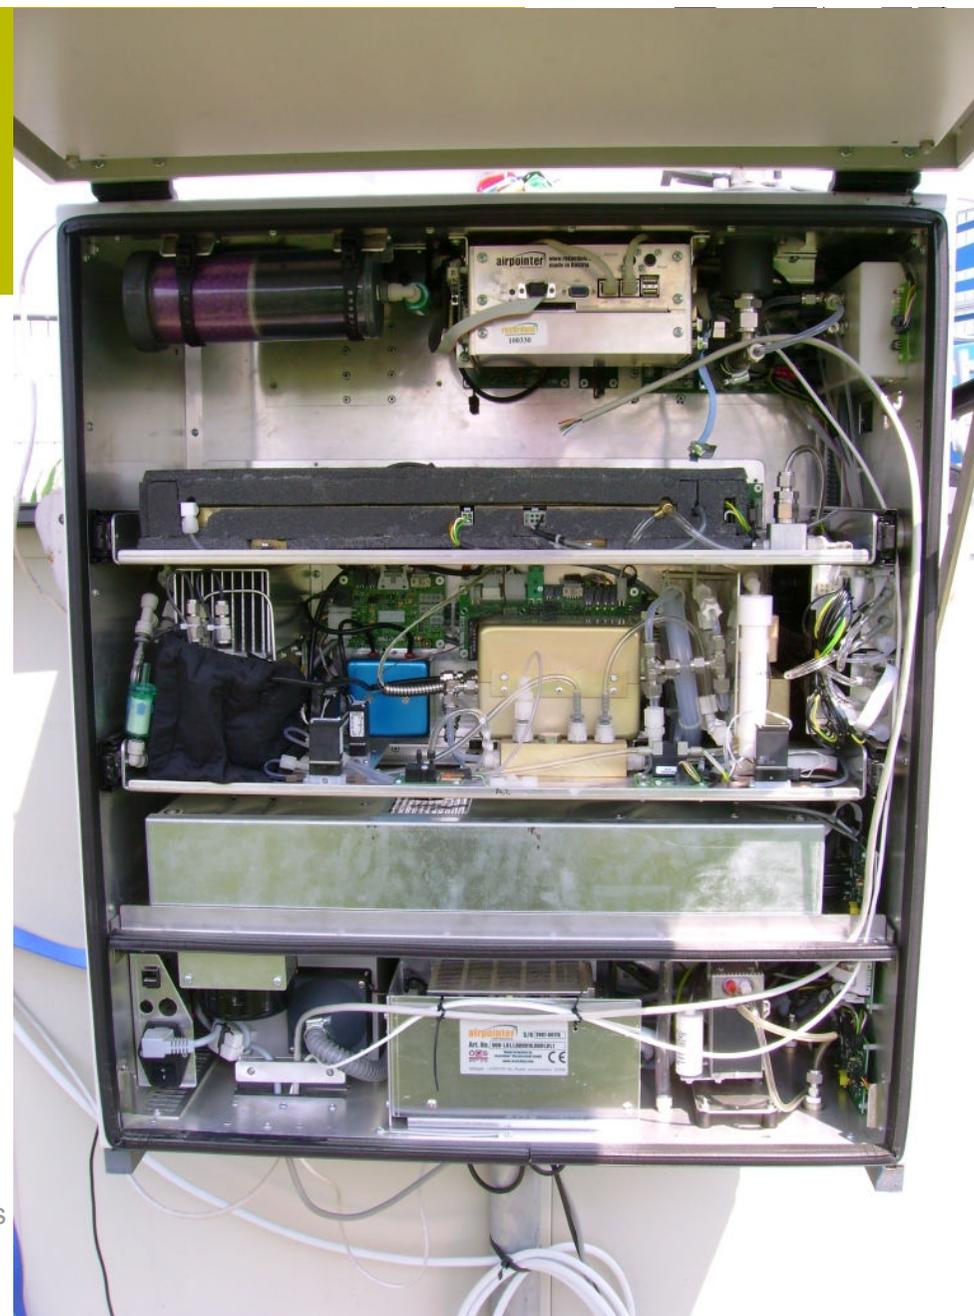

PM₁₀

- 24-hours with reference method (LVS)
- continuous with Osiris
- continuous with TEOM

Meteorological data

Traffic (partly)

NOx and Ozon with Airpointer

Measurement systems PM - LVS

- 24-hours with reference method (LVS)

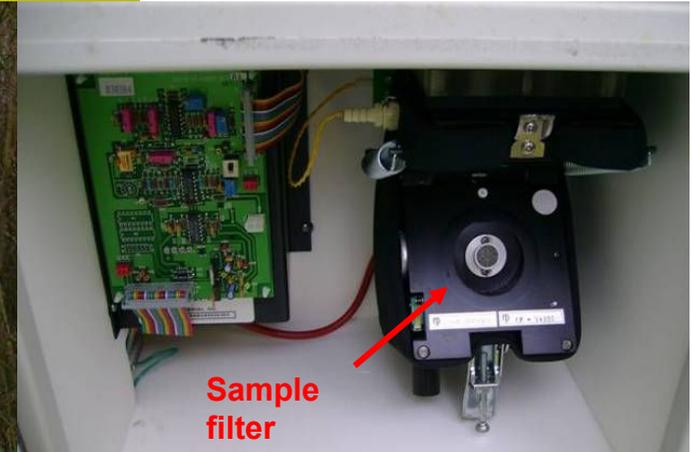

Measurement systems PM - Osiris

- continuous
- based on light scattering

- in results too much uncertainty

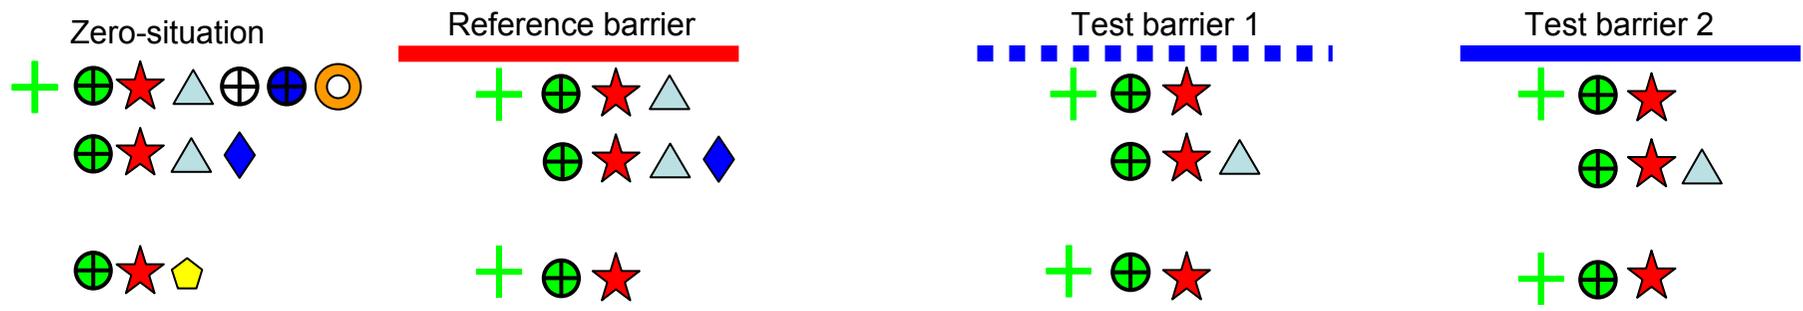

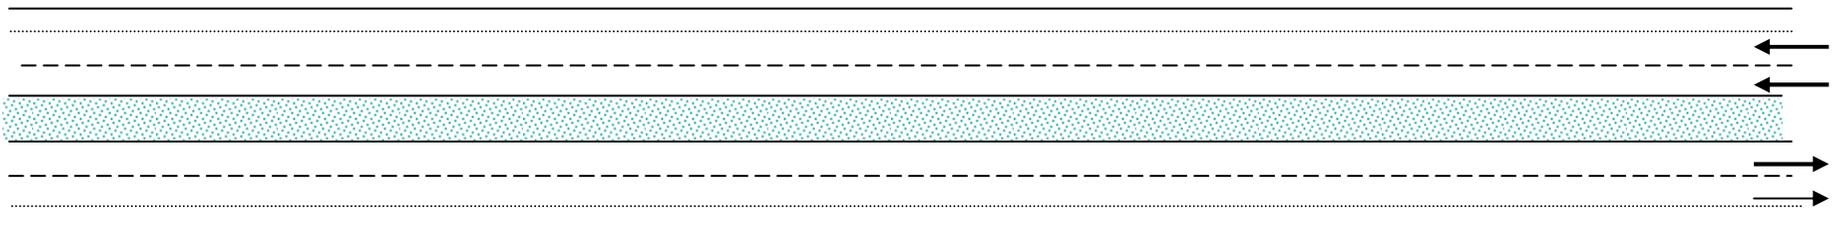

PM with TEOM

Instrument configuration

-  Real-time NOx measurement
-  Real-time O₃ measurement
-  PM10 reference method
-  PM2.5 reference method
-  Real-time PM Osiris
-  Real-time PM TEOM-FDMS
-  Real-time PM TEOM
-  Sunlight measurement
-  Meteorology measurement

Which barriers and when?

Session / period	barrier 1	barrier 2	barrier 3
1: July - October 2007	7-meter-high standard barrier	fibreboard concrete with TiO ₂ coating (Durisol)	4-meter-high reference barrier
2: December 2007 – March 2008	T-top barrier	vegetated barrier (Mostert de Winter)	
3: April – August 2008	Cleanscreen (Redubel)	Active Green noise barrier (Aacoustics)	
4: August – November 2008	Cleanstone (Tauw/Holland)	Greenbreath (MOWI/Bos variant)	
5: December 2008 - March 2009	7-meter-high standard barrier	no barrier

Optimised barriers NOx

Optimised barriers NO₂

Optimised barriers PM₁₀

Conclusions

Question 1

- do (noise) barriers have a significant impact on the dilution of airborne pollutants?

Answer

- both for NO_x and PM₁₀ significant effects
- barrier height is a important factor for the barrier effect

Conclusions

Question 2

- can barriers be optimised for this purpose?

Answer

- none of the innovative barriers scored significantly better than the 'reference barrier'

Thank you for your attention
